The ELO-L battery is the first standardized and standardized oral language assessment tool in Lebanon. This is an adaptation of the Oral Language Evaluation (ELO) battery developed in France by Khomsi (2001). This battery aims to evaluate different aspects of oral language by distinguishing reception and perception when it is relevant. The different language modules that are phonology, vocabulary and morphosyntax are concerned. Thus, this battery includes five tests, allowing to evaluate the lexicon in reception, the lexicon in production, the comprehension of statements, the production of utterances and the phonology. It allows to observe the performances and the linguistic profile of a child in order to decide on the necessity of a speech therapy reeducation. The ELO-L battery is therefore intended to be used exclusively by professionals with speech therapy training (or equivalent diploma).
